Assignment No:

## Question No. 1

The list price for a radio is $22 \%$ higher than its net price. If the net price is $\$ 29.00$, what is the list price? What is the amount of the trade discount?

## Answer- 1

Net price of Radio= $\$ 29$
List price is22 \% higher
i.e. List price/ Net price $=122 / 100$

Therefore List price $=122 / 100$ * 29
The calculation is accomplished as below:

| List Price | $\$$ | $\mathbf{3 5 , 3 8}$ |
| :--- | :---: | :---: |
| Net Price | $\$$ | 29,00 |
| Trade discount (amount) | $\$$ | 6,38 |
| Trade discount (percentage) |  | $\mathbf{1 8 , 0 3 \%}$ |

## Question No. 2

A certified public accountant discounts a bill to $\$ 294.00$ when a client pays in cash, within 10 days. If the cash discount is $1.5 \%$, how much would the customer have paid if he or she had not been eligible for the discount? Report the result to the nearest penny.

## Answer- 2

Discount = Bill amount * 1.5/100
Bill amount $=$ Discounted value + Discount $=$ Discounted amount + Bill amount * 1.5/100
Discounted value $=$ Bill amount (1-1.5/100) $=$ Bill amount * 98.5/100
or: Bill amount = Discounted value * 100/98.5

The above calculation is accomplished in Excel worksheet as below:

| Un-discounted bill | $\mathbf{\$}$ | $\mathbf{2 9 8 , 4 8}$ |
| :--- | :---: | :---: |
| Percentage discount |  | $1,50 \%$ |
| Discounted bill amount | $\$$ | 294,00 |
| Amount of discount | $\$$ | 4,48 |

## Question No. 3

Bill's Accounting is taking out a lease on \$2,000 worth of computing equipment and office furniture, over a two year period. The bank charges $8.25 \%$ interest annually. Compute the interest paid and the total amount paid for the lease.

PAGE- 2

## Answer- 3

## Principal repaid at the end of the period

Principal for first year as well as second year $=\$ 2000$
Annual Interest is calculated by the formula: I = P * r / 100
Where ' $r$ ' is the annual rate of interest
Here 'r' = 8.25
Therefore annual interest of \$ 2000 is: 2000 * 8.25/100 =
Interest for 2 years = Annual interest * 2

The above calculation is accomplished in Excel worksheet as below:

| Amount of loan | $\$$ | 2000,00 |  |  |
| :--- | ---: | ---: | ---: | ---: |
| Annual interest | $\$$ | 165,00 |  |  |
| Interest for 2 years |  |  | $\$$ | $\mathbf{3 3 0 , 0 0}$ |
| TOTAL AMOUNT PAYABLE |  | $\$$ | $\mathbf{2 3 3 0 , 0 0}$ |  |

## Question No. 4

You need to borrow \$5,000 for 2.33 years. Originally, the bank offers a $6.5 \%$ rate. Then, after some negotiation, they are willing to drop the rate to $5.5 \%$. What savings in interest will you have as a result of the rate reduction?

## Answer- 4

Annual Interest is calculated by the formula: $I=P$ * $r / 100$
Where ' $I$ ' is the interest amount and ' $r$ ' is the annual rate of interest
Here ' $r$ ' $=6.5$ in one case and 5.5 in the other case

Principal amount
\$ 5000,00
Period (Years)
2,33
Original interest rate (Percent)
6,50\%
Negotiated interest rate (Percent)
5,50\%

Annual interest (case-1) = 5000 * 6.5/ 100= Say 'x"
Interest for 2.33 years = 'x" *2.33
Annual interest (case-2 = 5000 * 5.5/100= Say 'y"
Interest for 2.33 years= 'y' * 2.33

Calculation in Excel Worksheet

|  |  |  |  | Annual Int. | Annual Int. | Annual | Savings for |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  | $6,50 \%$ |  | $5,50 \%$ | savings | 2.33 years |  |  |
| Principal amount | $\$$ | 5000,00 | $\$$ | 325,00 | $\$$ | 275,00 | $\$$ | 50,00 | $\$$ | $\mathbf{1 1 6 , 5 0}$ |

## Question- 5

PAGE- 3

A consumer loan is made at $10.0 \%$ over a 3.5 year period. If $\$ 2,125$ in interest is paid, what is the principal? What is the total amount paid by the consumer? Report the results to the nearest penny.

## Answer- 5

The amount payable against a loan taken on simple interest is given by the following equation
$I=P^{*} r / 100$ * $n$
Where
$\boldsymbol{P}$ is the principal
$\boldsymbol{r}$ is the rate of annual interest, and
$\boldsymbol{n}$ is the period in years
Based on above equation ' $P^{\prime}=\{' \mid 1 /(r / 100)\} / n=(100 * ' I ' / r) / n$
i.e.: = 'I' * $\{(100$ * $2125 /(10 / 100)\} / n=2125 * 10 / 3.5$

Principal amount (?) = ' $P^{\prime}$
Rate of interest= 10\% p.a
Period of loan $=3.5$ years
THE ABOVE IS ACCOMPLISHED IN EXCEL AS BELOW:

Rate of interest 10,00\%
Period of loan (years)
3,50
Interest paid
\$ 2 125,00
Principal amount (?) = 'p'
\$ 6071,43
